

Early detection of caries with DIAGNOcam

Ideal
for children
and adults

See decay in a whole new light...

Ask your dentist today about the radiation-free early detection of tooth decay!

- **Efficient:** If tooth decay is detected early, there is often less need for drilling.
- **Simple:** Light is shone through the tooth and carious (decayed) spots become visible.
- **Radiation-free:** An image of the examined tooth is created – without any X-ray radiation at all!

A recommendation from your practice team.
