Causes damage to the lung through prolonged or repeated exposure. Route of exposure: Inhalation.
- **Additional toxicological information:**  
The product is not subject to classification according to the calculation method of the General EU Classification Guidelines for Preparations as issued in the latest version. Prolonged and/or massive exposure to respirable quartz and cristobalite-containing dust may cause silicosis, a nodular pulmonary fibrosis caused by the deposition in the lungs of the fine respirable particles. The International Agency for Research on Cancer believes that crystalline silica and cristobalite inhaled from occupational sources can cause lung cancer in human. There was however indicated that not all working circumstances as well as not all crystalline silica types are considered as suspected. Scientific sources put forward that crystalline silica is not genotoxic.  
There is valid proof that the fact supports that the increased chance on cancer is reduced for people who suffer meanwhile from silicose. According to the current criteria, protection against the sickness silicose has been sufficiently guaranteed by observing the existing profession regulations.
